

As part of the TRUAA project for the implementation of Earthquake Early Warning System for the state of Israel, the Israel Seismic Network (ISN) was upgraded and densified, with more than 100 seismic stations, transmitting real-time seismic data to the data-hubs at Jerusalem and Lod. A thorough and comprehensive description of the new seismic network and the level of its performance have been presented in a paper recently published in the peer-reviewed journal, *Seismological Research Letters*. We ask that any use of TRUAA's data, beginning from 2018 onwards, will give appropriate credit to the following publication:
